EDIT PROGRAM CODE TO RUN
MCU Test program

```

1 var portname = "COM9"; /* Serial port on PC or on Raspberry Pi */
2
3 /* Virtual module added in Setup(Trigger) section (other tab) */
4 /* In this case we added one module with the address "A0" in the domain "HomeAutomation.MCU"
5 domain of type "Switch" and using the "generic switch" widget for displaying it in the control
6 panel. There are other widgets that can be used (sensor, door, window, light, dimmer etc..)
7 Btw, a program can also create more than just one module by using AddVirtualModules. */
8 //Program.AddVirtualModule("HomeAutomation.MCU", "A0", "Switch", "homegenie/generic/switch");
9
10 /* We will use this module */
11 /* Now, to get a reference to your virtual module: */
12 var module = Modules.InDomain("HomeAutomation.MCU").WithAddress("A0").Get();
13 /* var mod1 = Modules.InDomain("HomeAutomation.X10").WithAddress("A2"); */
14
15 /* Serial Reception */
16 /* HandleMessageReceived(): ASCII
17 * HandleStringReceived(): UTF-8 */
18 Action<string>
19 HandleStringReceived = (string message) =>
20 {

```

Configure Home Actions

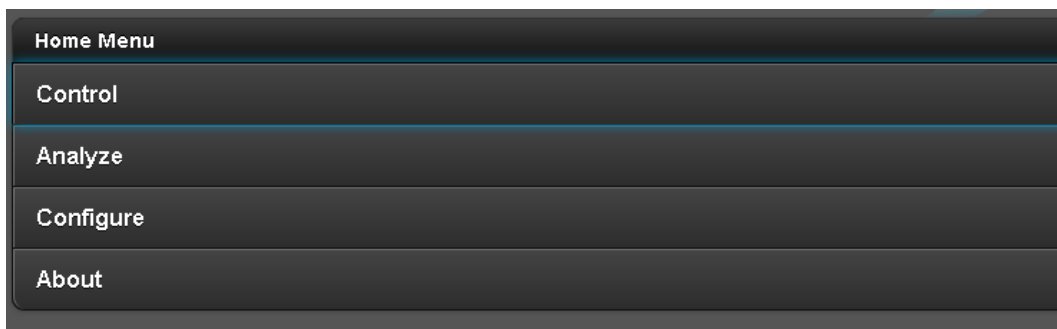

Update module

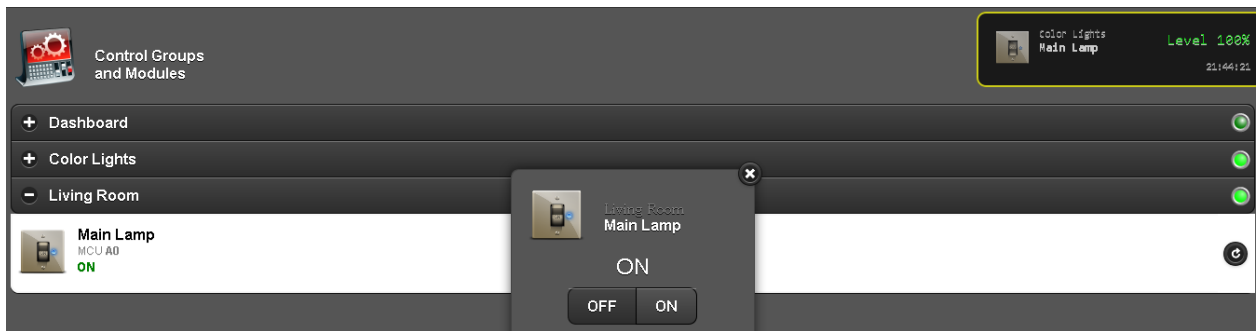

For Advanced users list of parameters:

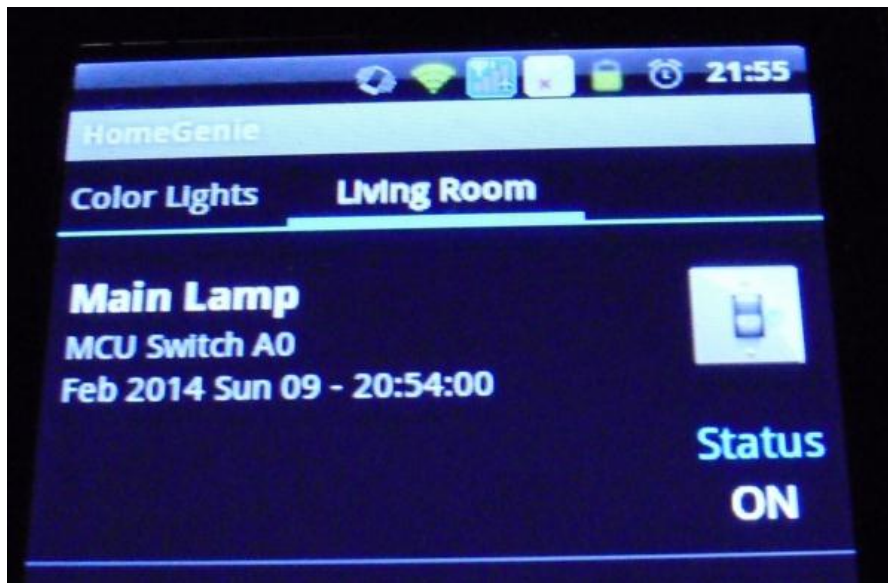

Control: this is what you would normally use

Now you are ready to play around.

Best part is that it automatically shows up on Andoid/WindowsMobile app:

API documentation

http://www.homegenie.it/docs_old/learn.html

Hint:

Check other sample codes in HomeGenie.
