

Fun spuit

What you need

- An Arduino
- A relay
- A pump
- Wires

Step 1

Cut only the red wire of the plug. Connect the positive from the pump and the relay to the pump make sure it's connected in a normal open way. This will make sure the pump doesn't start when you plug in the electricity.

Step 2

Connect the Arduino to the relay. Connect ground to ground, 5V to 5V and pin 12 from the Arduino to the relay input pin. This is basically it.
